01

INTRODUCTION

This project focuses on testing the OpenCart e-commerce website hosted on a local server using XAMPP.

Our goal was to verify that all website functions work properly, identify defects, and ensure that the system is stable and userfriendly.

We tested the application manually, through APIs, and directly from the database to confirm both frontend and backend accuracy.

02

SCOPE OF TESTING

The scope of this testing project includes the following modules:

- 1-User Registration and Login**
- 2-Search Functionality**
- 3-Add to Cart & Checkout**
- 4-Product Categories**
- 5-Payment and Order Confirmation**
- 6-Database Validation (Data stored correctly after actions)**
- 7-API Validation for product and user endpoints**

03

TOOLS USED

Tool	Purpose
XAMPP	To host the OpenCart website locally
MySQL Database	To verify data storage and integrity
Postman	For API Testing
Google Sheets	To document Test Cases and Bug Reports
Browser (Chrome)	For Manual Testing execution

04

TESTING TYPES PERFORMED

1-Manual Testing

We performed manual testing to verify the user interface, workflow, and website functionality.

Each tester created test cases, executed them, and reported the results (Pass/Fail).

We covered scenarios like registration, login, searching, adding products to cart, checkout, and logout.

2- API Testing

Using Postman, we verified several endpoints, including:

Get all products

Add new user

Login

Place order

Each request was validated using response code, response time, and response body.

3- Database Testing

We used phpMyAdmin (MySQL) to check if the data entered through the UI was stored correctly.

For example:

.Verifying that registered users appear in the user table.

Checking that orders are saved in the orders table.

Ensuring product stock updates after purchase.

05

TEST CASES SUMMARY

Test Type	Number of Test Cases	Passed	Failed
Manual Testing	367	321	46
API Testing	23	14	9
Database Testing	24	24	-
UI Testing	41	39	2
Total	455	398	57

Test Results & Observations

- Most of the core functionalities (registration, login, add to cart, and checkout) work properly.
- Minor issues were found in search filtering, checkout validation, and UI alignment.
- API responses were mostly accurate, but some endpoints lacked proper error handling.
- Database synchronization was consistent, confirming backend reliability.

06

CONCLUSIONS

In conclusion, the OpenCart local testing project successfully covered the main functionalities of an e commerce website using Manual, API, and Database testing approaches.

All six team members contributed equally in planning, executing, and documenting the results.

The project helped us understand the complete software testing process from requirement analysis to final reporting and improved our teamwork, analytical, and documentation skills.
